DEVELOPER PORTFOLIO

Dayananda A.

Full-Stack Developer | Generative AI Developer

Building useful software.
Making AI practical.

Developer with 1 year of hands-on experience across web, backend, mobile and AI-powered application development. Interested in building maintainable software and integrating machine learning and large language model capabilities into practical products.

ROLE FOCUS	Full-Stack Development · Generative AI · Applied AI/ML

PORTFOLIO NOTE

This document distinguishes developed projects from work in progress and proposed concepts. Technologies and descriptions should be checked against the final code and actual project state before submission to an employer.

01 | PROFESSIONAL PROFILE

I work across the software development lifecycle: understanding requirements, creating user interfaces, integrating backend services, working with databases and connecting AI capabilities through APIs. My project experience includes OCR-based document processing, LLM-powered conversational interfaces, face-authentication UI integration and Flutter application development.

I am targeting roles where I can contribute to full-stack application development while continuing to build practical expertise in Generative AI, retrieval-augmented generation and applied machine learning.

CORE STRENGTHS

Full-stack development	Frontend interfaces, backend services, REST API integration and database-backed workflows.
Applied Generative AI	LLM API integration, prompt-driven experiences, document workflows and RAG concepts.
Problem-solving	Breaking application requirements into manageable features and validating end-to-end behavior.

02 | TECHNICAL SKILLS

Frontend	React.js, Vue.js, JavaScript, HTML5, CSS3, Tailwind CSS
Backend & APIs	Python, Flask, Node.js, Express.js, REST API integration
AI / ML	Machine Learning, Deep Learning fundamentals, OCR, Hugging Face
Generative AI	LLM APIs, prompt engineering concepts, RAG concepts and workflows
Mobile	Flutter, Dart, Android application development
Databases & tools	MongoDB, MySQL, SQLite, Git, GitHub, Postman, VS Code

Skill list reflects the technologies discussed for your projects. Be prepared to explain your level of independence and practical usage for each item.

03 | FEATURED PROJECTS

DEVELOPED PROJECT · OCR + RAG

Intelligent Document Extraction

A document-processing project focused on extracting structured information from handwritten and printed forms using OCR and LLM-assisted processing. The project connects document input, text extraction and structured output generation.

Technologies: Python · Tesseract OCR · Hugging Face Transformers · LLM APIs · RAG concepts

Interview discussion points: image preprocessing and OCR quality; mapping extracted text into fields; handling uncertain or missing values; where retrieval is used in the workflow; validating generated output.

DEVELOPED PROJECT · LLM APPLICATION

AI Personality Chatbot

A conversational web application designed to provide personality-oriented responses through an LLM API. The project demonstrates frontend-to-model integration and the design of an interactive chat experience.

Technologies: Vue.js · LLM APIs

Interview discussion points: request/response flow; prompt structure; loading and error states; conversation context; API key protection and server-side integration considerations.

DEVELOPED PROJECT · AUTHENTICATION UI

Face Authentication Login System

A React-based login experience that integrates face-related APIs for a face-authentication workflow.

Technologies: React.js · Face APIs

Interview discussion points: frontend capture flow; API interaction; success/failure handling; privacy and security limitations; why liveness detection and secure server-side verification matter.

03 | FEATURED PROJECTS — CONTINUED

BUILT PROJECT · MOBILE APPLICATION

Coaching Center Management App

A Flutter Android application created for coaching-center management workflows. It demonstrates mobile UI development and translating an education-domain requirement into an application.

Technologies: Flutter · Dart · Android

Confirm before interview: final feature modules; local persistence/database; state management; backup/export behavior; app build and release status.

IN PROGRESS · MERN APPLICATION

Student Management System

A MERN-stack application focused on student registration and student-record management through backend APIs and database operations.

Technologies: MongoDB · Express.js · React.js · Node.js

Current scope: registration and validation; REST API development; CRUD operations; database integration. Keep the project labelled in progress until the full workflow is tested end-to-end.

PROJECT STATUS INTEGRITY

The following are exploratory or proposed concepts and are intentionally not represented as completed projects: AI form extraction, coffee-bean vision analysis, underwater plastic detection and a multi-domain AI API orchestrator. They can become future case studies after implementation, testing and documentation.

04 | EDUCATION & CONTINUOUS LEARNING

AI / ML Course Certification

Course coverage reported by the candidate:

• Advanced Python Programming

• Machine Learning

• Deep Learning

• Generative AI & Large Language Models

• Retrieval-Augmented Generation (RAG)

Credential details to complete: exact course title, training provider, completion date and certificate URL or credential ID. Add these details so a recruiter can verify the certification.

05 | INTERVIEW TALKING POINTS

For each featured project, prepare a concise explanation covering the problem, your individual contribution, architecture, data flow, key technical decision, hardest issue, testing approach and what you would improve next.

OCR + RAG	Explain OCR versus retrieval; how extracted text becomes structured fields; how you evaluate extraction quality; when RAG is genuinely useful.
LLM chatbot	Explain prompt design, context handling, API calls, latency, errors, token/cost considerations and safe API-key handling.
Face login	Explain the API integration and distinguish a UI prototype from secure biometric authentication.
Flutter app	Walk through navigation, state, persistence, offline behavior (if implemented), and how you tested the app.
MERN app	Explain schema design, validation, routes/controllers, CRUD behavior, error handling and current unfinished work.
